ABSTRACT

Approximately 120 published pre-school and Kindergarten tests (including over 630 subtests with separately normed scores) were evaluated through the MEAN test evaluation procedure which reflects four main areas of concern: measurement validity, examinee appropriateness, administrative usability, and normed technical excellence. Evaluation results are presented in tabular form and are indexed by the educational objective to which they are keyed, and by test name. An index of publishers and distributors of available Preschool and Kindergarten tests is also included. (MS)

RESEARCH CENTER**

UCLA Graduate School of Education

The **CENTER FOR THE STUDY OF EVALUATION** is one of eight university-based centers for educational research and development sponsored by the United States Office of Education, Department of Health, Education and Welfare. The **EARLY CHILDHOOD RESEARCH CENTER** is one of five university-based centers funded by the Office of Economic Opportunity for research with young disadvantaged children. The research and development reported herein was performed pursuant to contracts with the Office of Education under provisions of the Cooperative Research Act, and the Office of Economic Opportunity, and does not necessarily reflect the views of those agencies. This publication is not printed at the expense of the Federal Government.

iii

FOREWORD

The Center for the Study of Evaluation (CSE) is pleased to join with the Early Childhood Research Center (ECRC) in publishing the *CSE-ECRC Preschool/Kindergarten Test Evaluations*. This book represents the second in a series of test evaluation compendia which began with the publication of the *CSE Elementary School Test Evaluations** in 1970. Both books are products of CSE's School Evaluation Project which is directed by Ralph Hoepfner.

Dr. Hoepfner and his colleagues became concerned with test evaluation as they grappled with the problem of selecting instruments to be used in needs assessment evaluations. While the original intention was not to engage in an extensive assessment of published tests, the pressing need for a reliable guide to such materials was painfully apparent. However, before embarking on the formidable task of evaluating hundreds of tests, many of which had achieved a sanctified status over years of unquestioned use, an objective set of criteria had to be developed. The MEAN procedure, described in detail in the introduction to this volume, provides a simple and systematic approach to test evaluation. It offers reviewers, selectors, and users of tests the following five advantages:

1. *Conciseness*, by furnishing an easy-to-use reference to aid in test selection;
2. *Currency*, by bringing together in one reference all the tests which were available from publishers at the time this volume went to press;
3. *Educational relevance*, by relating individual subtests to specific educational goals and objectives as expressed by both specialists and teachers;
4. *Objectivity*, by utilizing the explicit MEAN criteria and purchasing all test materials;
5. *Consistency*, by evaluating all tests against a single set of criteria.

By presenting ally measures, as measures, this bo for selecting the m ment objective, w

FOREWORD

Center for the Study of Evaluation (CSE) is pleased to announce the publication of *Early Childhood Research Center (ECRC) in public school/Kindergarten Test Evaluations*, the second in a series of test evaluation commentaries. The publication of the *CSE Elementary School Test Evaluations* in 1970. Both books are products of CSE's efforts, which is directed by Ralph Hoepfner. CSE's colleagues became concerned with test selection and with the problem of selecting instruments for assessment evaluations. While the original intent was an extensive assessment of published tests, a reliable guide to such materials was not possible. Before embarking on the formidable task of tests, many of which had achieved widespread use, an objective set of criteria was needed. The MEAN procedure, described in this volume, provides a simple and systematic method of evaluation. It offers reviewers, selectors, and users five advantages:

1. Providing an easy-to-use reference to aid

2. Bringing together in one reference all the tests available from publishers at the time this volume

3. Facilitating, by relating individual subtests to specific goals and objectives as expressed by teachers;

4. Clarifying the explicit MEAN criteria and the materials;

5. Evaluating all tests against a single set of

By presenting a clearer picture of what a particular test actually measures, as compared to what its title or creator says it measures, this book provides the potential test user with a basis for selecting the most appropriate instrument for a specific measurement objective, within the normal school context.

It is quite likely that the ratings reported here will be extremely disappointing to those who expect a list of ready-made tests to answer all of their evaluation questions. Unfortunately, the state of the art cannot yet offer any panaceas. However, balancing the rather dismal picture presented by the bulk of the published tests, it should be noted that there is tremendous ferment in the field of assessment of young children. Many measurement specialists, supported by large grants from public and private sources, are energetically engaged in the development of more precise tools to assess the outcomes of various types of intervention programs. Hopefully this book will be useful not only to the directors, principals, and counselors concerned with young children, but also will assist our research colleagues and test publishers by identifying the large number of important areas where no adequate instrumentation exists, and by providing specific criteria for constructing better and more useful assessment measures.

Richard Seligman, Acting Director**
Center for the Study of Evaluation

Carolyn Stern, Director
Early Childhood Research Center

*CSE Elementary School Test Evaluations. Edited by Ralph Hoepfner, assisted by Guy Strickland, Gretchen Stangel, Patrice Jansen, and Marianne Patalino Center for the Study of Evaluation, UCLA Graduate School of Education, Los Angeles, California.

Table of Contents

Foreword	v
Introduction	ix
Preschool Test Evaluations	Tables P1 through P14
Kindergarten Test Evaluations	Tables K1 through K23
Index A – Index of Goals	43
Index B – Index of Tests	45
Index C – Publishers and Distributors of Available Tests Appropriate for Assessment at the Preschool and Kindergarten Level	53

This book contains a compendium of tests, keyed to educational objectives of early education, and evaluated by measurement experts and educators for such characteristics as meaningfulness, examinee appropriateness, administrative usability, and quality of standardization. The “periodic table” of tests and objectives is designed for use by school principals and directors who do not necessarily have technical expertise in educational measurement and evaluation, yet its rigorous treatment will make it of interest to educational evaluators and psychometricians.

ACCOUNTABILITY IN EARLY CHILDHOOD EDUCATION

During the decade of the sixties, an unprecedented and widespread concern with the growth and development of disadvantaged preschool children culminated in the crystallization of two divergent approaches to the education of young children. The pioneering work of Froebel, Pestalozzi, and Dewey had led to the rejection of the homunculus concept of the young child, and the beginning of the twentieth century saw the development of the nursery school. Here the emphasis was on providing a nurturing environment which would facilitate the fullest emergence of the inherent nature of each child. Instead of a rigorous curriculum of structured rote learning modeled on that of older children, these programs usually stressed socialization, large muscle activities, and creative self-expression through a variety of art media. For over thirty years the nursery school settings met the needs of their middle-class patrons, while at the same time a parallel system of institutionalized day care was provided for the protected custody of children from broken homes or those from poor, over-burdened, incompetent, or otherwise disadvantaged families.

In the late fifties, these disparate provisions for young children came under attack from two unrelated sources. The degree to which the American educational system lagged behind that of the Russians, especially in the areas of science and mathematics, led many middle-class parents to protest at the inadequate academic diet provided in the early years of schooling. Quite ironically, many middle-class parents were attracted by the didactic, content-oriented programs developed by Maria Montessori for disadvantaged young Italian children. The subsequent establishment of American Montessori preschools presented the first major departure from the almost solidly child-development approach which had characterized the early nursery school movement.

At about the same time, the consistently low levels of academic performance of children from poor homes came under political and educational criticism. A number of investigators explored the effects of experimental interventions modeled after the prevalent nursery schools, with special focus on providing various types of "enrichment" experiences, such as trips to zoos, museums, airports, etc. Although the children in the compensatory preschools compared

ABILITY IN EARLY SCHOOL EDUCATION

In the sixties, an unprecedented and widespread growth and development of disadvantaged children occurred in the crystallization of two divergent types of young children. The pioneering work of Montessori and Dewey had led to the rejection of the traditional view of the young child, and the beginning of the development of the nursery school. Providing a nurturing environment which recognized the emergence of the inherent nature of the child, a rigorous curriculum of structured rote learning for older children, these programs usually included gross muscle activities, and creative self-expression through art media. For over thirty years the needs of their middle-class patrons, a parallel system of institutionalized day care protected custody of children from broken homes, over-burdened, incompetent, or other-

disparate provisions for young children from unrelated sources. The degree to which the Head Start system lagged behind that of the Russian system of science and mathematics, led many to question the test at the inadequate academic diet of schooling. Quite ironically, many were attracted by the didactic, content-oriented approach of Maria Montessori for disadvantaged children. The subsequent establishment of American Head Start marked the first major departure from the traditional approach which had characterized early childhood development.

The consistently low levels of academic achievement in poor homes came under political and public scrutiny. A number of investigators explored the effects of Head Start as modeled after the prevalent nursery school approach on providing various types of "enrichment" activities: trips to zoos, museums, airports, etc. The compensatory preschools compared

favorably with peers from the same type of economic environment, when they entered elementary school they were still far below their middle-class counterparts.

To many concerned with the educational problems of young children from poor families, it seemed quite clear that these children needed a curriculum which would place greater stress on the acquisition of preacademic skills. At the University of Illinois, Bereiter and Engelmann reported dramatic success using a highly-structured verbal bombardment technique to present an academic program. Other researchers had explored different types of cognitively-oriented approaches. McCandless, Hodges & Spicker at Indiana University, Sprigle in Florida, Stern & Keislar at UCLA and Weikart in Ypsilanti, are but a few of the investigators who were engaged in the development of academically-oriented curricula before Project Head Start, the most revolutionary educational enterprise since the advent of the public school, burst into national prominence in the summer of 1965.

Having caught the imagination of all segments of the population, the program was over-subscribed from its inception, with the number of children enrolled far greater than the most optimistic enthusiasts had anticipated. Even before the end of the summer, the overwhelming demand for a continuation of Head Start as a full-year program was politically irresistible.

Through default or design, administrative and curricular decisions were delegated to local Head Start agencies, permitting a tremendous amount of variation within broad general guidelines. Highly-structured academic, child-centered developmental, laissez-faire baby-sitting, and all the gradations between, went under the rubric of "Head Start." In spite of the wide range of permissible orientations, the legislation authorizing the federal appropriations included a requirement for evaluation of program effectiveness. The press for performance criteria may be attributed to Senator Robert Kennedy, who, while disclaiming any expertise in either education or measurement, demanded that an evaluation component be built into every federally-funded educational program. While this position found few ardent supporters among educators, government economists made it quite clear that continued funding would be dependent upon the demonstration of "cost-benefits" in terms of measurable increments in I.Q. points or gains on standard

antagonism was further aggravated by the lack of experimental evaluation of the system by the end users and program personnel.

From a measurement point of view, related to the separation of the two domains, there is a great disparity between what is measured by the tests and the content of the tests used to measure them. In the first year of the national curriculum, students were asked to indicate what they considered to be the objectives of the Head of the State. Their responses showed that their emphasis was directed towards the positive self-concept and social skills, rather than under the affective domain. The tests also measured psychomotor skills, including fine motor skills, movement as well as perceptual-motor skills, and cognitive modalities. The lowest priority was given to specific academic skills. The results of the tests received with one set of objectives and another set of different criteria has contributed to the disillusionment in the degree to which the curriculum meets the high hopes with which it was developed. No premature blowout of a trumpet should be sounded. No received such extensive new curriculum has ever indicted on such irrelevant

Exploding the notion that we should be expected to produce many different varieties of unrelated abilities and their positive repercussions. It represents an approach to accountability that is not. The Educational Testing Service, the Head Start children, and the individuals responsible for the evaluation of the experiment as well as the Federal Government tentatively attempted to tailor the goals of the particular program to be developed, field tested, and evaluated. Constraints of funding contracts to use published and standard procedures through years of acceptance to look critically at such measures.

ely separated the respon-
ogram administration and
ood that the opposition of
ed. On the contrary, the

antagonism was further aggravated by the attempt to maintain an
experimental evaluation design in which interaction between
testers and program personnel would be held to a minimum.

From a measurement point of view, an even more serious prob-
lem, related to the separation of program from assessment, was the
great disparity between what teachers valued and taught and the
content of the tests used to estimate the success of the program.
In the first year of the national Head Start evaluation, teachers
were asked to indicate what they conceived to be the major goals
or objectives of the Head Start program. With very few exceptions,
their emphasis was directed toward personality variables, e.g.
positive self-concept and social interactions, which are subsumed
under the affective domain. Second in order of priority were the
psychomotor skills, including both large and small muscle develop-
ment as well as perceptual discrimination in the various sensory
modalities. The lowest priorities were given to the acquisition of
specific academic skills. The anomalous situation of programs con-
ceived with one set of objectives being assessed in terms of quite
different criteria has contributed considerably to a popular dis-
illusionment in the degree to which Head Start has been able to
meet the high hopes with which the program had been launched.
No premature blowout of a missile intended for outer space ever
received such extensive news coverage, nor was a broad program
ever indicted on such irrelevant evidence.

Exploding the notion that anything called "Head Start" could
be expected to produce magical and global increments in a wide
variety of unrelated abilities in all kinds of children did have some
positive repercussions. It resulted in a much more meaningful
approach to accountability evaluation with this young age group.
The Educational Testing Service in its Longitudinal Study with
Head Start children, and the Stanford Research Institute which is
responsible for the evaluation of the Head Start Planned Variations
experiment as well as the Follow Through program, have consis-
tently attempted to tailor their measures to reflect the expressed
goals of the particular program. Unfortunately, instruments cannot
be developed, field tested, and adequately normed, under the time
constraints of funding contracts. In many cases it is more expedient
to use published and standard tests which have become established
through years of acceptance in the field, but it is not always easy
to look critically at such measures.

Taxonomy of Early Childhood Education Goals

The purpose of this book is to extend the use of the MEAN test evaluation system, originally developed by the Center for the Study of Evaluation and applied to the assessment of elementary school tests in a previous publication, to commercially available tests for preschool and kindergarten children. However, because the stance adopted here is both pragmatic and objective rather than theoretical, the first step has been to interview a wide spectrum of practitioners, including teachers, supervisors, and early childhood specialists, as well as to conduct an exhaustive search of the program and research literature, to obtain as comprehensive a statement as possible of the professed objectives of preschool and kindergarten education. No goals were eliminated merely because they seemed inappropriate in terms of the ideology or philosophy of any member of the staff employed in the preparation of the book. All these goals were translated into operational definitions of the desired behaviors, and these descriptors were then grouped together so as to form the logical taxonomy which follows.

Taxonomy of Goals of Preschool-Kindergarten Education THE AFFECTIVE DOMAIN

1. Development of Personality

A. Shyness-Boldness

Is not excessively modest, seclusive, or reserved; does not avoid or withdraw from personal contact; is not overly dominant or boisterous; avoids excessive exhibition or ascendance; can be a good leader and a good follower; has social poise.

B. Neuroticism-Adjustment

Feels generally happy; tolerates variety and frustration; is not overly moody, irritable, timid, sensitive, or somber; is not excessively anxious, apprehensive, fearful, or emotional.

C. General Activity-Lethargy

Maintains a healthy level of activity and curiosity; is not excessively apathetic, lethargic, fatigued, or listless; has a healthy amount of stamina, endurance, and energy.

D. Dependence-Independence

Becomes increasingly self-responsible, self-sufficient, and autonomous; has a healthy need for affiliation, friendship, and love; does not have an excessive need for attention,

Early Childhood Education Goals

The book is to extend the use of the MEAN originally developed by the Center for the applied to the assessment of elementary school children. This publication, to commercially available kindergarten children. However, because it is both pragmatic and objective rather than prescriptive, the first step has been to interview a wide spectrum of teachers, supervisors, and early childhood educators as well as to conduct an exhaustive search of the literature, to obtain as comprehensive a list of the professed objectives of preschool and kindergarten as possible. No goals were eliminated merely because they were not in terms of the ideology or philosophy of the Center, but only if employed in the preparation of the book. The goals were translated into operational definitions of the descriptors and these descriptors were then grouped together in a taxonomy which follows.

Preschool-Kindergarten Education EFFECTIVE DOMAIN

Personality

Is usually modest, seclusive, or reserved; does not draw too much from personal contact; is not overly dominant; avoids excessive exhibition or ascendance; is a leader and a good follower; has social poise.

Adjustment

Is happy; tolerates variety and frustration; is not easily irritable, timid, sensitive, or somber; is not easily anxious, apprehensive, fearful, or emotional.

Lethargy

Has a healthy level of activity and curiosity; is not apathetic, lethargic, fatigued, or listless; has a good stamina, endurance, and energy.

Dependence

Is singly self-responsible, self-sufficient, and has a healthy need for affiliation, friendship, but does not have an excessive need for attention,

acceptance, approval, security, or succorance.

E. Self-Esteem

Develops a healthy self-concept, self-esteem, and self-confidence; develops a sense of personal worth, self understanding, and security; develops an ability to present self to others with confidence.

2. Development of Social Skills

A. Hostility-Friendliness

Strives to be considerate of others, forgiving, friendly, affectionate, and cooperative; begins to be aware of needs, feelings, and wishes of others; is interested in people; makes and keeps friends; begins to develop positive affective means for emotional release; has a sense of humor; is not excessively angry, aggressive, hostile, aloof, or defensive; is not selfish or self-centered.

B. Socialization-Rebelliousness

Knows when to conform and the worth of obedience; avoids excessive rebelliousness; does not reject authority or disrespect his country; is not persistently disorganized, sloppy, or reckless; develops a reasonable and consistent code of behavior; is capable of self discipline, is courteous, polite, respectful, and hospitable; expects no special privileges or advantages; respects public and private property; shares things willingly.

C. Moral Belief and Practice

Applies moral precepts to everyday life; understands moral doctrines of honesty, fairness, respect, and integrity; knows right from wrong.

3. Development of Motivation for Learning

A. School Orientation

Develops a favorable attitude toward attending school, teachers, school administrators, learning, and an interest in academic subjects.

B. Need Achievement

Is reasonably ambitious, persistent, and competitive; develops reasonable aspirations; continues direction in spite of frustration, handicaps, failures, and difficulties; has a reasonable need for superiority; does his best; recognizes his best efforts; appreciates the achievements of others; sets standards for himself.

C. Interest Areas

Begins to develop a wide variety of interests; engages in various indoor and outdoor recreational activities; enjoys many school subjects and activities; begins to develop potential career interests.

4. Development of Aesthetic Appreciation

A. Appreciation of Art

Responds emotionally to moods and feelings in art; enjoys non-directed self expression through the various art media; expresses satisfaction and pride in creativity and self expression; makes judgments about art work, including his own.

B. Music Appreciation

Likes different types of music; develops interest in music as a part of school and life experiences; appreciates beauty as expressed through song and dance; develops enjoyment of music; uses music and dance as a means for self expression.

THE INTELLECTUAL DOMAIN

5. Cognitive Functioning

A. Spatial Reasoning

Develops and uses skills in spatial visualization and orientation; is able to identify directions, such as up, down, over, under, with or without own body as reference.

B. Classificatory Reasoning

Recognizes and produces superordinate-subordinate relationships or class membership based on common properties; uses classification schemes consistently; evaluates classification schemes.

C. Relational-Implicational Reasoning

Recognizes and produces syllogism, analogies, syllogistic, and analogic reasoning; recognizes and produces inferential solutions to problems.

D. Systematic Reasoning

Recognizes, produces, and evaluates complex rules and relations, including ordering tasks; uses the analytic-deductive conceptual style; solves complex problems.

E. Attention Span

Develops selective attention; increases overall time of con-

of interests; engages in
ational activities; enjoys
t begins to develop poten-

and feelings in art; enjoys
h the various art media;
creativity and self expres-
work, including his own.

velops interest in music as

ases overall time of con-

centration; attends to a wider variety of stimuli; can easily
shift attention as needed.

6. Creativity

A. Fluency

Develops fluent production and processing of familiar infor-
mation; fluently produces and elaborates upon information;
fluently produces original information.

B. Flexibility

Recognizes the identity of an object or process seen from
different viewpoints; produces reinterpretations and redefini-
tions of known information; learns basic conservation prin-
ciples, e.g., conservation of volume.

7. Memory

A. Span and Serial Memory

Memorizes series, sequences, and lists by rote.

B. Meaningful Memory

Remembers meaningful ideas and information, non rote.

C. Visual Memory

Remembers what things looked like, how they were shaped.

D. Auditory Memory

Repeats spoken series; listens for specific details; imitates
sounds and patterns; repeats oral selections; repeats varia-
tions in pitch, stress, and punctuation; associates letter
sounds and forms.

THE PSYCHOMOTOR DOMAIN

8. Physical Coordination

A. Eye-Hand Coordination

Is able to draw a line; can copy and trace basic forms; learns
to use manipulative toys; aims and throws accurately.

B. Small Muscle Coordination

Is able to hold a pencil in a position for writing; open a book
and turn its pages; screw nuts on and off bolts; is able to use
scissors proficiently; can color within boundaries of lines.

C. Large Muscle and Motor Coordination

Learns to move his body at varying speeds and with varying means of locomotion; is able to control balance during body movements; holds and carries objects carefully, responds to rhythm with body movements; shows controlled walking, running, skipping, jumping, and other fundamental actions.

THE SUBJECT ACHIEVEMENT DOMAIN

9. Arts and Crafts

A. Arts and Crafts Comprehension

Makes discriminations in types of art; recognizes the various media; gains awareness of the many things that can be made out of common materials; develops knowledge of art terminology, vocabulary and concepts.

B. Expressive and Representational Skill in Arts and Crafts

Explores, experiments, and produces expressive and representational works in various media; shows creativity and originality, communicates ideas and feelings.

10. Foreign Language

A. Oral Comprehension of a Foreign Language

Responds to basic and idiomatic foreign language.

B. Speaking Fluency in a Foreign Language

Speaks basic and idiomatic language in an acceptable manner; develops spontaneous expressiveness; speaks with good pronunciation.

C. Interest in and Application of a Foreign Language

Participants in foreign language activities in class and independently.

D. Cultural Insight Through a Foreign Language

Understands another culture; accepts another culture due to study of the language.

11. Function and Structure of the Human Body

A. Identification of Body Parts and Positions

Knows and can identify various external body parts; manipulates them on command; identifies right and left body parts.

B. Growth and

Begins to understand the value of

B. Growth and Development

Begins to understand the process of growing up; understands
the value of rest and sleep and the value of exercise.

C. Knowledge of Emotional Health

Understands his emotions; knows how the environment,
events, and physical well-being can affect the feelings, emo-
tions and behaviors; is aware of how people may act when
sad, angry, disappointed, hungry, tired, etc.

D. Identification of Self and Surroundings

Has realistic mental image of his own body; understands his
relationship to the immediate environment.

12. Health

A. Knowledge of Personal Hygiene and Grooming

Develops knowledge of cleanliness in relation to health,
learns table manners; understands care of teeth and the
function of food in building and maintaining the teeth.

B. Practicing Personal Hygiene and Grooming

Keeps hands and fingernails clean; learns toilet training;
dresses self; cares for hair; keeps clothes neat and clean;
practices dental health; cares for eyes, ears, and nose; de-
velops good posture habits.

C. Knowledge of Food and Nutrition

Learns the importance of drinking water; realizes the value
of milk and dairy products in the diet; learns the importance
of eating regular meals.

D. Practicing Food and Nutrition

Eats balanced meals; drinks proper amount of water.

E. Knowledge of Prevention and Control of Disease

Learns detection of symptoms of disease; understands the
relationship between cleanliness and health; learns simple
first-aid procedures; understands the purpose of immuniza-
tion.

F. Practicing Prevention and Control of Disease

Treats and avoids colds; uses simple first-aid procedures;
sleeps enough; gets proper amount of exercise and activity.

xiii

13. Mathematics

A. Counting and Operations with Integers

Recites numbers correctly and in order; relates counted numbers to numerosity of things; adds and subtracts whole numbers; checks answers.

B. Comprehension of Sets in Mathematics

Recognizes sets and understands set membership; performs basic set operations.

C. Comprehension of Numbers in Mathematics

Identifies and discriminates numbers and numerals; knows cardinal and ordinal numbers and the number line; knows odd and even numbers.

D. Comprehension of Equality and Inequality in Mathematics

Understands basic ideas of numerical equality and inequality; understands ideas of parts of things and how they relate to the whole; familiarity with fractional terminology.

E. Arithmetic Problem Solving

Solves simple problems of everyday life; learns names of coins and value relationships; develops an interest in problem solving.

F. Measurement Reading and Making

Understands concepts of length, volume, weight, time, and temperature, and how to measure them.

G. Geometric Vocabulary and Recognition

Recognizes, names, basic geometric shapes and components; understands the concept of closed figures, curved and straight; makes basic comparisons among geometric shapes.

14. Music

A. Aural Identification and Music Knowledge

Recognizes melodies of familiar songs; recognizes obvious changes in tempo, dynamics, rhythm, and harmony; learns to listen to identify sounds; identifies simple musical instruments.

B. Singing

Sings in tune and with good tone quality; begins to sing rhythmically; develops happy, spontaneous group singing.

C. Instrument Playing

Explores the sounds of percussion instruments and various ways to play them; learns to play simple patterns of tone and rhythm.

D. Rhythmic Response (Dance)

Keeps time with music; develops ability to respond to music through large body movements; expresses himself freely in dance; imitates rhythmic movements; learns simple dances.

15. Oral Language Skills

A. Oral Semantic Skills

Utilizes a spoken vocabulary relevant to needs and emotions, to home and family, to school activities, to community and environment.

B. Oral Phonology Skills

Produces initial, medial, and final consonant sounds; consonant blends, and digraph sounds, and long and short vowel sounds in spoken words.

C. Oral Syntactic Skills

Uses complete sentences; uses determiners, auxiliary words, and verb tenses correctly; constructs substitutes or parts of speech and transformations.

D. Oral Morphology Skills

Forms plurals of parts of speech; constructs and uses compounds and contractions; uses possessives correctly; constructs and uses prefixes and suffixes correctly.

16. Readiness Skills

A. General Readiness Skills

Recognizes spoken word meanings; understands pictorial representations of meanings; translates between auditory and pictorial representations of meanings; follows directions.

B. Visual Discrimination and Recognition

Distinguishes and names colors, shapes, sizes, and letter forms rapidly and accurately; reads from left to right; has good figure-ground distinction; develops mental imagery.

C. Auditory Discrimination and Recognition

Differentiates among sounds; identifies gross sounds and common environmental sounds; differentiates directions of sources of sounds; distinguishes among sound characteristics; identifies the number of words in a sentence and the number of syllables in a word; identifies accented syllables.

D. Kinesthetic and Tactile Perception

Kinesthetic and tactile recognition and perception.

17. Reading and Writing

A. Recognition of Word Meanings

Has growing reading vocabulary; recognizes word meanings through context; recognizes synonyms and opposites.

B. Understanding Ideational Complexes

Grasps the thought of short written sentences and paragraphs; recognizes main ideas of longer written communications.

C. Oral Reading

Reads aloud with smoothness, emphasis, and intonations; phrases reading correctly by attending to punctuation marks.

D. Writing

Independently writes name and basic words.

E. Familiarity with Standard Children's Literature

Is acquainted with a variety of children's classics.

18. Religion

A. Religious Belief and Practice

Applies religious precepts to everyday life; understands basic religious doctrines; participates in religious activities and believes in his religion.

19. Safety

A. Understanding Safety Principles

Understanding reasons for practicing safety; knows common causes of accidents; has knowledge of safety principles to help

20. Science

A. Observation

ition and perception.

prevent accidents; knows what to do in case of an accident
or other emergency.

B. Practicing Safety Principles

Puts into practice his safety knowledge to avoid accidents
and maximize safety.

20. Science

A. Observation and Exploration

Observes and explores the world around him, including the
earth, matter, environment, and living things.

B. Knowledge of Scientific Facts

Develops basic science vocabulary; knows of important scien-
tists and their discoveries or inventions.

C. Appreciation of the Scientific Approach

Develops a scientific attitude toward the unknown; develops
an appreciation of nature; acquires techniques of scientific
procedure; appreciates science's benefits to man.

D. Development and Application of Scientific Attitude

Develops scientific interests as leisure time activities; uses
science as a means of problem solving by making observa-
tions, asking questions, gathering evidence, and evaluating
conclusions.

21. Social Studies

A. Community Health and Safety

Learns about community helpers who protect our health
and safety; knows how children can help to maintain com-
munity health and safety.

B. Cultural-Economic Geography

Becomes aware of people in other countries and appreciates
their contributions; understands relationships of home, fam-
ily, and community; knows roles and values of various types
of workers, communications, and travel.

les

acticing safety; knows common
edge of safety principles to help

C. Democratic Practices

Knows about citizenship, national holidays, basic rights, and freedoms (flag and other patriotic symbols); knows about our government; relates democratic practices to his own environment.

D. Physical Geography

Knows about nature and the environment; learns way to and from school; knows his neighborhood; learns simple geographic concepts; understands simple maps; learns concepts of distance and direction.

E. History

Develops a sense of the past; acquires simple historical facts; understands the meaning of some holidays; begins interpreting current events and developing an interest in them.

The MEAN Evaluation System

In addition to the development of a comprehensive objectives-based classification of goals for early-childhood education, the Center for the Study of Evaluation (CSE) and the Early Childhood Research Center (ECRC) adapted the critical MEAN test evaluation procedure to apply to measurement devices in all of the goal areas.

Preparatory to the test evaluation, a thorough canvass of test catalogs and test publishers was undertaken, and all tests suitable for this population, except clinical or projective measures, were ordered. The regular list price was paid for all materials so as to avoid any implication of bias. When approximately half of the tests ordered had been received, the review process was initiated. Unfortunately, not all of the tests arrived promptly and a cut-off date had to be set so that the book could be completed. The final compilation covers approximately 120 tests, including over 630 subtests with separately normed scores. Each test was categorized as a preschool (30 to 59 months) measure and/or a kindergarten (60 to 72 months) measure according to the publishers' claims. The tests were then evaluated in order to identify and endorse those measures most appropriate, effective, and useful in assessing schools or students.

MEAN is an acronym reflecting four critical areas of concern to test users: Measurement validity, Examinee appropriateness, Administrative usability, and Normed technical excellence.

Measurement Validity

Criteria. Although content, and predictive validity was in terms of measurement, the specific measures were instructed in the each test was judged against particular objective which were made in terms of whole range of behavior goal, and the number focused on this goal.

Frequently the idea that a test did not measure such cases, the test makers agreed was more difficult a judgment recognizable focus; but narrow or specific goal categories of the taxonomy goal in an acceptable assigned to the education relevant. In the latter of the goal that the plurality of its variables line for the assignment where it would receive validity criterion.

Two examples of tests to goals. Although designed as measure with some aspects of scoring manuals led to are differentially related tests are scored solely recognizable characteristics assigned to goal categories functioning. However, elements either of positional accuracy category 9B, Expression

r critical areas of concern
xaminee appropriateness,
technical excellence.

Measurement Validity

Criteria. Although empirical measurements of construct, content, and predictive validities were also used, the primary consideration was in terms of face validity, i.e., How well does the test measure the specific goal behavior? Members of the review team were instructed in the use of the taxonomy of educational goals and each test was judged according to its capacity to assess that particular objective which seemed most appropriate to it. Judgments were made in terms of the extent to which the items assessed the whole range of behavior or content subsumed under the particular goal, and the number of items within the scale which were actually focused on this goal behavior.

Frequently the independent judgment of several reviewers was that a test did not measure the construct indicated in its title. In such cases, the test was assigned to the goal area which the evaluators agreed was more appropriate to it. Usually this was not too difficult a judgment to make since most tests did seem to have a recognizable focus; however, there were several measures with very narrow or specific goals which did not fit into any of the larger categories of the taxonomy, or else failed to cover even a very limited goal in an acceptable fashion. In the former case, the test was assigned to the educational goal to which it appeared to be most relevant. In the latter case, the test was considered to be a measure of the goal that the plurality of its items (and presumably then the plurality of its variance) appeared to reflect. The underlying guideline for the assignment of a measure to a goal area was to place it where it would receive the maximum score on the Measurement validity criterion.

Two examples can be cited to illustrate the "forced" fitting of tests to goals. Although most tests of the "draw-a-man" type are designed as measures of intelligence, and do correlate moderately with some aspects of intellectual functioning, careful study of the scoring manuals led the evaluators to agree that two separate skills are differentially reflected in the scores obtained. When drawing tests are scored solely on the basis of an enumeration of the recognizable characteristics included in the drawing, the test was assigned to goal category 6A, Fluency, an aspect of intellectual functioning. However, when the scoring was complicated by judgments either of positioning of drawn characteristics or the representational accuracy of the drawing, the test was assigned to category 9B, Expressive and Representational Skill in Arts and

Crafts. While either type of scoring might be seen as an assessment of goal 7C, Visual Memory, the lack of controlled presentation-reproduction formats argued against assignment to this goal.

A second example concerns the (Raven) *Coloured Progressive Matrices*, which is commonly used to assess general intellectual development among language-different populations. After careful consideration of the tasks involved, however, it seemed that the appropriate goal descriptors would be either 5A, Spatial Reasoning, or 5D, Systematic Reasoning. The evaluators agreed that the children's form of the test with which they were concerned, would be best placed in the latter category.

It appeared that situations where tests were forced unwillingly into foreign goal categories were not too common and, in fact, that very few tests for educational output are based upon any explicit model of education or evaluation at all. With the further supposition that evaluation cannot logically proceed on a global level, but that concepts must be refined and analyzed into reasonably small units in order for them to have much meaning in any evaluation program, it was felt that perhaps less injustice would be forced upon the tests through this evaluation procedure than the tests themselves might be forcing upon unsuspecting young children and their schools.

Point Assignment. (0 to 15 points for grade)

- a. *How well does the test appear to measure the specific educational objective? Examination of instructions and items with psychological (content) insight, and consideration of reported construct-validation research led to a subjective rating from 0 to 10 points.*
- b. *How much direct or indirect evidence for predictive or concurrent validity is there? Examination of technical and administration manuals for supportive research on the test led to a subjective judgment on a scale from 0 to 5 points. No attempt was made to comb the research literature for additional or more recent supportive findings.*

Examinee Appropriateness

Criteria. The second criterion of the MEAN evaluation system is that of appropriateness of the test materials, including content of the stimuli and mode of response, relative to the age and grade level of the examinees. All tests were classified by age level prior to

the review process. The place in these materials is a method that is not the kindergarten

n of the MEAN evaluation system
e test materials, including content
onse, relative to the age and grade
were classified by age level prior to

the review process. Because of the rapid changes which are taking
place in these early years, a format, or illustration, or response
method that is wholly inappropriate for the preschooler may offer
the kindergarten child much less of a challenge.

Evaluation of the appropriateness of a test's level of compre-
hension took into consideration the test's content and instructions.
Specifically, evaluation of content centered upon the difficulty of
the behavioral, pictorial, semantic, or numerical items and also upon
the relevance or interest-arousing aspects of the items. At the pre-
school and kindergarten levels tests frequently have item content
that is inappropriate in comprehension for that level. The evalua-
tion of the test's instructions focused on clarity and comprehension.
Again, the comprehension level of the instructions was often found
to be inappropriate. There is a noticeable lack of information avail-
able to the authors of test instructions on the concepts and syntax
appropriate to the young child. This state of affairs is particularly
worrisome, because no matter how intriguing the test items may be,
if the child does not know exactly what to do with them, the test
score will probably not reflect the desired behavior.

The second major area where appropriateness is felt to be
important is that of test format, both visual and auditory, and the
test's timing and pacing. Experience in test administration has high-
lighted the fact that young children are often confused by formats
that appear simple to adults. The visual principles employed in test-
page layout were evaluated in terms of effective usage of Gestalt
visual principles. Instruments with closely packed items are clearly
inappropriate for young children. The evaluation looked for specific
format features such as sufficiency of white space between items,
visual coherence of item stems and alternatives, and effective use
of color as an aid in segregating items.

Going beyond the whole-page format, the evaluation also con-
sidered the quality of illustrations and typography. Pictorial and
geometric item material was evaluated according to the print clarity,
representational meaningfulness, and ease of decoding for young
children. Similarly, evaluations of typography were made in terms
of clarity, size, and type-face, at all times considering the perceptual
limitations of the examinees. Since many tests for the preschool and
kindergarten levels have an auditory component, test format was
also evaluated for the standardization of the auditory presentation.

The psychometric problem of speed vs. power tests also found
its place in the evaluation of examinee appropriateness. Published

xvii

statements regarding the speededness of tests were corroborated, when possible, by consulting item difficulty indexes and score distributions. For each scale, pacing or time limits were judged for their appropriateness for the subject matter and for the examinees. In almost all cases, power was preferred to speed as an attribute of tests of educational output.

The last aspect of appropriateness considered was the mode of response recording. Simple and direct connections between the item stem and the recording of a response were evaluated more favorably than complicated conversions from item stems to alternatives. Among the especially easy response modes were pointing, oral responses, or marking directly over printed alternatives.

The various aspects of the criterion of Examinee Appropriateness could not be applied to assessment devices in the forms of rating scales, rating schedules, and observation schedules, where the examinee (the child being assessed) is not actively involved in responding to specific demands of the assessment device, but is merely behaving in his own manner. In the cases where the instrument demanded no active response from the examinee, the instrument was not evaluated according to the second MEAN criterion, and its overall evaluation indicates a void for the second evaluation. It was felt that a void, that is no evaluation, was preferable to any alternate arbitrary decision on how examinee appropriateness could be judged for instruments not impinging upon the examinee.

Point Assignment. (0 to 15 points for grade)

- a. *How appropriate is the comprehension level for the age and educational level to which the test is directed? Examination of the instrument that the examinee sees or hears in terms of comprehension, both of items and instructions led to two subjective judgments of 0 to 4 points each.*
- b. *How well is the test printed and organized for ease of the examinees, or is taking the test a test in itself? Examination of test-page format in terms of effective usage of Gestalt visual principles resulted in a subjective rating from 0 to 2 points, quality of print or illustrations in a rating from 0 to 2 points, standardization of auditory presentation a rating from 0 to 1 point, and appropriateness of pacing in a rating from 0 to 1 point.*
- c. *Is the response recording procedure simple and direct for the examinee? The rating was from 0 to 1 point.*

ess of tests were corroborated, difficulty indexes and score distribution limits were judged for their clarity and for the examinees. In addition to speed as an attribute of

ed and organized for ease of the test a test in itself? Examinee, in terms of effective usage of the test, resulted in a subjective rating of clarity of print or illustrations in a standardization of auditory presentation to 1 point, and appropriateness of 0 to 1 point.

procedure simple and direct for the examinee was from 0 to 1 point.

Administrative usability

Criteria. After asking such questions as "What will it measure?" and "Is it designed for my students?" the next question was concerned with how usable the test is in terms of administration, scoring, interpretation, and decision making. These aspects of utilization comprised the third evaluation criterion of the MEAN system.

For general assessment of educational output, a test that can be administered to a large group is desirable. Small-group (9 students or less) and individually administered instruments, although having their unique advantages, are not efficient for educational evaluation. It should be noted that all individually administered tests therefore suffer from this evaluative decision, and consequently their ratings indicate less usability. It cannot be stressed too strongly, however, that this limitation of usability is relevant *only* to evaluation of educational programs and systems, and *not* to in-depth individual placement, diagnosis, or prognosis.

A second variable strongly affecting a test's utility is the training necessary to administer the test properly. Since few schools have resident psychometrists, developmental psychologists, audiologists, or speech therapists, a test was deemed to have greater utility if it can be administered by the school staff, preferably the students' teacher or a paraprofessional. The time necessary for test administration also affects its utility. Under the assumption that the average attention span of young children is no more than about 20 minutes, tests were credited if they fit into one such time unit, but were not credited if their lengths necessitated special scheduling.

The utility of a test is further affected by the scoring procedure it requires. Simple and objective hand or machine scoring of tests was considered optimal for utility, while difficult and subjective scoring received respectively less credit. Although the general usefulness of tests is not much altered by slight variations in scoring difficulty, tests scored on a purely subjective basis cannot be considered as reasonable candidates for educational evaluation instruments. For this reason, no projective measures were reviewed.

From a pragmatic viewpoint, while ease of administration and scoring are desirable, a much more basic consideration is that the scores obtained be susceptible to meaningful interpretation. Scores can only be interpreted normatively through some method of score standardization or conversion. If the score conversion is to maintain the interval or ordinal properties of the test instrument as much as possible, it must be based on data obtained under standard

conditions with a broad normative sample.

The samples utilized in test norming were evaluated according to two criteria—breadth and representativeness. A broad normative sample is one which includes a wider age group than the one for which the test is constructed. For example, an instrument for kindergarten students, should include in its norm sample some students from the preschool as well as the first and second grades so that both low and high performers at the kindergarten level can be assessed normatively.

After the test has been administered to its normative sample, the raw scores from that sample are isomorphically mapped into some standardized conversion system, the most common of which include centiles, standard scores, stanines, grade equivalents, T scores, and mental ages. There are many other such conversion systems used by different test publishers, but these are either uncommon or statistically naive.

The normative score conversions were evaluated according to three criteria. If the derived scale is common and generally understood, the test was given credit. If the conversion to the derived, normed scores is clear, with unambiguous tables presented and described, the test earned credit over those with complicated, multi-stage conversions. These two aspects of the derived scores determines in part who is able to interpret them. Tests yielding scores interpretable by the school staff are preferred to those demanding the skills of a psychometrist or other specialist.

In addition to the breadth of the sample, the norm group should also be representative of the variety of subgroups that comprise the national population. While a test normed on a restricted sample may be quite adequate for purely local needs, the trend in educational evaluation is not in that direction. With national questions being asked, federal support for education and related research, and national problems to be solved, a representative national normative sample becomes a most desirable quality of educational tests. To be considered good, the sample was expected to meet the criteria of recency, representation of geographic areas, ages, racial and ethnic origin, and types of schools. It might be important to note that few test publishers have done their normative sampling very well, and that the technical manuals abound with obfuscatory and quasi-scientific, if not downright misleading sampling techniques.

The final pragmatic consideration of a test's utility rested on whether or not decisions, either individual or group, could be made. Tests with manuals that clearly describe both score interpretation

and subsequent

normative sample. In test norming were evaluated according to representativeness. A broad normative sample includes a wider age group than the one for which the test is intended. For example, an instrument for kindergarten should include in its norm sample some students as well as the first and second grades so that the test is applicable to performers at the kindergarten level can

When administered to its normative sample, the test scores are isomorphically mapped into a conversion system, the most common of which are raw scores, stanines, grade equivalents, etc. There are many other such conversion systems used by test publishers, but these are either naive.

Test conversions were evaluated according to the following criteria. A simple conversion system is common and generally under-estimated. If the conversion to the derived score is with unambiguous tables presented and the test is credited over those with complicated, multi-step conversions, two aspects of the derived scores determine the ease to interpret them. Tests yielding scores that require a school staff are preferred to those demanding a psychologist or other specialist.

The breadth of the sample, the norm group should include the variety of subgroups that comprise the population. While a test normed on a restricted sample or purely local needs, the trend in education is in that direction. With national questions and the need for education and related research, and involved, a representative national normative sample of desirable quality of educational tests. To be a good sample was expected to meet the criteria of representativeness of geographic areas, ages, racial and ethnic groups. It might be important to note that few tests have their normative sampling very well, and many tests abound with obfuscatory and quasi-scientific misleading sampling techniques.

The consideration of a test's utility rested on whether either individual or group, could be made. A test that clearly describe both score interpretation

and subsequent prescriptive decisions that might be made, were evaluated as better than those with doubtful decision-making utility.

Point Assignment. (0 to 15 points for grade)

- a. *Is the test easily and conveniently administered? Administration of the test from individual situations to small groups to large groups resulted in credit of 0 to 2 points. The need for training of the test administrators was credited with 1 point if school staff were sufficient and 0 points if a psychometrist or specialist were needed. Tests needing more than 20 minutes were credited 0 points; tests needing less time, 1 point.*
- b. *Can the test be easily and reliably scored? Simple, objective scoring that can be done by the administrator or a scoring service received 2 points, while more difficult but objective scoring earned 1 point and subjective scoring received 0 points. A test having a mixture of scoring procedures was evaluated on the basis of its least reliably scored items.*
- c. *Is the score interpretation simple, through use of clear and adequate norms and descriptions? If the norm range is broad, 1 point was credited; if restricted, 0 points. Common and simple interpreted scoring systems received 1 point, while uncommon or abstruse systems received 0 points. If conversion from raw to normed scores is clear and simple with graphs or tables, 2 points were credited. Simple, but not well presented conversions received 1 point and complicated conversions received 0 points. One point was credited for current, national, and well-sampled normative groups and 0 points were credited for normative samples that are local, outdated, or poorly sampled.*
- d. *What qualifications must the score interpreter have? If school staff can interpret the scores accurately, 1 point was earned; if a psychometrist or specialist is necessary for accurate interpretation, 0 points were credited.*
- e. *Can decisions be made on the basis of the scores? Tests with manuals providing tables or charts for prescriptive educational decision making were credited with 3 points. If the claim is made and appears to be reasonable that decisions can be made, 2 points were earned. The possibility or implication of decision aiding earned a test 1 point, while the doubtful nature of a test in decision-making potential earned it 0 points.*

Normed technical excellence

Criteria. The last major criterion of the MEAN evaluation procedure was concerned with the reliability, replicability, and refinement of measurement of the tests. Three types of reliability estimates were considered in this aspect of the MEAN evaluation: (1) test-retest reliability, appropriate for assessing a measure's (and examinee's) long-range stability; (2) internal consistency reliability, useful in determining how coherently the test items assess some dimension of behavior; and (3) alternate-form reliability, desirable when treatment effects are to be evaluated with alternate forms of a test.

Since all three types of reliability estimates are more or less relevant to questions of educational achievement assessment to an equal degree, they were all included as aspects of the MEAN evaluation procedure. This tactic was necessitated by the fact that selection of any one of the estimates with omission of the remaining two would do violence to the fourth-criterion rating for many of the test instruments.

Closely related to the concept of test reliability is that of replicability of procedures to obtain the normed scores. If procedures described in test manuals are complicated, non-specific or based upon abnormal samples, the test is clearly not replicable in its findings and therefore is less useful for the educator.

The range of coverage is also an important aspect of a test's technical excellence. A restricted range of assessment limits the test's interpretability. A test which is appropriate for one level of assessment but can also be applied to students from one to two years above and below that level, has obvious advantages because both advanced and retarded students can be compared with the normative sample.

Related to the range problem is the refinement or graduation of the inter-individual comparison scores. Tests yielding scores transformed into centiles or grade placements were rated as well graduated and standard; deciles, stanines, and similar scales were rated as either poor or uncommon; pass-fail, quartiles, and novel scales were rated as both poor and uncommon.

Point Assignment. (9 to 15 points for grade)

- a. *How reliable is the test? Three reliability ratings were made; one each for stability (test-retest), internal-consistency (Kuder-Richardson, alpha, split-half, or odd-even), and alternate-form reliabilities. Points were assigned*

Three types of reliability estimates of the MEAN evaluation: (1) internal consistency for assessing a measure's reliability; (2) internal consistency showing how coherently the test items relate; and (3) alternate-form reliability. Effects are to be evaluated with

reliability estimates are more or less for achievement assessment to an extent as aspects of the MEAN evaluation necessitated by the fact that selection and omission of the remaining two criterion rating for many of the test

of test reliability is that of replicability of normed scores. If procedures are complicated, non-specific or based on criteria clearly not replicable in its findings to the educator.

an important aspect of a test's range of assessment limits the extent to which is appropriate for one level of difficulty and to students from one to two years has obvious advantages because scores can be compared with the

is the refinement or graduation of normed scores. Tests yielding scores for placements were rated as well as stanines, and similar scales were used; pass-fail, quartiles, and novel scales uncommon.

(points for grade)

Three reliability ratings were used: (1) test-retest, (2) internal-consistency (alpha), split-half, or odd-even, and (3) internal-consistency. Points were assigned

according to the size of the reported reliability coefficients, computed from a specific, limited age group. An appropriate coefficient of .90 or more earned 3 points; .80 to .90 earned 2 points; .70 to .80 earned 1 point; and less than .70 earned 0 points.

- b. Are normed scores obtained under replicable conditions? If so, 1 point was earned; if not, 0 points were earned.
- c. Does the test have an adequate range of coverage? Test score distributions with more than adequate ranges received 3 points, and distributions with adequate floor and ceiling (or tests for which ceilings were predetermined by the nature of the subject matter) for the specific group received 2 points. Whenever examinees appeared to have reached the floor or ceiling, or there was evidence of score truncation, 1 point was assigned. If no information was given to make an evaluation, or even to extrapolate one from centile conversion tables, 0 points were assigned.
- d. Are the scores standard, well-graduated inter-individual comparison scores? Scores that are well graduated received 2 points. Scores that are well graduated, but perhaps not easily understood, or poorly graduated but commonly utilized were credited with 1 point. Scores that are poorly graduated and difficult to understand were given 0 points.

Implementation of the MEAN Evaluation System

The team of test evaluators consisted of a graduate assistant with a masters degree in psychological measurement, one with a masters degree in educational and developmental psychology, two experienced preschool teachers at the baccalaureate level, and an experienced nursery school director. This team brought relevant competencies to all of the many varieties of tests within the purview of the evaluation program. The several categories of evaluation were assigned to those members of the team with appropriate expertise in that area. Each test was independently rated according to the MEAN system by at least two raters working without access to the other raters. For each subscale to be evaluated, each reviewer used a standard rating procedure (see Figure 1). The raters inde-

pendently assigned each test or subtest, and in many cases individual items, to one of the goal categories. The final adjudication for both test assignment to goal area as well as the ratings on each of the four evaluation criteria, was carried out by Ralph Hoepfner, followed by review and discussion with Carolyn Stern and Susan Nummedal.

The primary concerns in the application of the MEAN system were the objectivity and consistency of the evaluations. To maximize both the objectivity for any one test evaluator and the consistency across evaluators, the above specific guidelines for evaluation of each aspect of each criterion and the following lettergrade assignment were adopted.

st evaluator and the consist-
fic guidelines for evaluation
following lettergrade assign-

Within any one of the four evaluative categories, a letter grade, based on the points assigned to each aspect of each criterion, was computed. The sum of the points, ranging from 0 to 15, was the determinant of the letter grades in the following manner:

"G" (*Good; 11-15 points*). The test meets the criterion very well. Little improvement appears necessary for its immediate utilization. CSE and ECRC would endorse such a measure or employ it in their own assessment efforts.

"F" (*Fair; 6-10 points*). The instrument is probably among the better tests available, but it does not completely meet the criteria.

xxi

Alterations would probably render the test a candidate for "G" status. If no better qualified measure were available, the Centers would employ an "F" measure, but would interpret results more cautiously.

"P" (*Poor; 0-5 points*). The instrument does not meet the criterion; it is clearly unsatisfactory in that area. Rather than employ such a measure for assessment, it would be better to seek an alternate device or attempt to develop one.

Each test then earned four letter grades by the MEAN system. The four-letter combination serves as the Centers' official evaluation of the test. For example: Acme Readiness Test (GFPP). It should be noted that not only are the MEAN criteria in the order of suggested importance to the sponsoring Centers, but that the points possible for each aspect of any criterion reflect the importance placed on that aspect. Should the goals of the reader not coincide with those of the Centers, then the MEAN evaluations should be interpreted with different emphasis.

Utilizing the evaluation procedure described above and the MEAN evaluation forms, all published tests that are generally available to educators and psychometrists (about 631 scales and subscales) were evaluated and adjudicated. The evaluations appear in the body of this book.

The MEAN Test Evaluations

In the following sections, all of the evaluative judgments for all available tests are presented. The tabular format is designed to provide a maximum of useful information in an organized and readable manner. The columns on all the following pages follow the rating criteria in the same order as they have been discussed above. The numbers in the shaded section of each table indicate the range of points in which the judgments could be made, and are supplied on each table merely for reference.

As an additional aid to the reader, the tests are further coded according to whether they are individually administered (° in left column) or are rating instruments (* in the left column). Group tests are unmarked.

Consistent with the strong commitment of both Centers to objectives—referenced measurement, each of the two evaluation sections (one section for preschool tests and one for kindergarten tests) is organized according to the hierarchy of educational goals outlined in the Taxonomy above. To aid the reader, both goal and test name indexes are supplied at the end of this book. All test names are given as they appear on the tests themselves, and not necessarily as they appear in catalogs or common parlance (although such names are referenced in the Test Name Index). Parenthesized letters are publishers abbreviations. Index C lists all the pertinent publishers with their most recent addresses.

INDEX A

INDEX OF GOALS

Appreciation of Art (4A) P2, K3
 Appreciation of the Scientific Approach (20C) P14, K23
 Arithmetic Problem Solving (13E) P9, K14
 Arts and Crafts (9) P7, K11
 Arts and Crafts Comprehension (9A) P7, K11
 Attention Span (5E) P3, K6
 Auditory Discrimination and Recognition (16C) P13, K21
 Auditory Memory (7D) P5, K8
 Aural Identification and Music Knowledge (14A) P9, K14

 Classificatory Reasoning (5B) P3, K5
 Cognitive Functioning (5) P2, K3
 Community Health and Safety (21A) P14, K23
 Comprehension of Equality and Inequality in Mathematics (13D)
 P9, K13
 Comprehension of Numbers in Mathematics (13C) P9, K13
 Comprehension of Sets in Mathematics (13B) P9, K13
 Counting and Operations With Integers (13A) P8, K13
 Creativity (6) P3, K6
 Cultural-Economic Geography (21B) P14, K23
 Cultural Insight Through a Foreign Language (10D) P7, K12

 Democratic Practices (21C) P14, K23
 Dependence-Independence (1D) P1, K1
 Development and Application of Scientific Attitude (20D) P14, K23
 Development of Aesthetic Appreciation (4) P2, K3
 Development of Motivation for Learning (3) P1, K3
 Development of Personality (1) P1, K1
 Development of Social Skills (2) P1, K2

 Expressive and Representational Skill in Arts and Crafts (9B)
 P7, K11
 Eye-Hand Coordination (8A) P5, K9

 Familiarity With Standard Children's Literature (17E) P14, K23
 Flexibility (6B) P4, K7
 Fluency (6A) P3, K6
 Foreign Language (10) P7, K11
 Function and Structure of the Human Body (11) P7, K12
